

Erin's World Frame Line

CREATED BY SPEC4US

FITTING GUIDE

Erin's World Frame Line is designed to fit individuals with low or flat nose bridges. Our frame design is different than what your opticians have fit in the past. Many opticians are used to fitting an oversized lens to compensate for the width that most of our patients need.

We have taken care of this issue with a few adjustments; by adding 10 mm on each end of the eye wire, adjusting temple placement, and lowering the bridge to prevent slipping and allow proper balance and support. These adjustments allow patients to look through the optical center of the lens rather than over the lens. This will mean less decentration and a better-looking frame. For example, if your patient fits a 40-eye size in a typical frame, they may fit a 38-eye size in Erin's World Frame Line.

Our temple diameter on most models is the same throughout the length of the temple and can be cut down to size if needed. Models #11, 12, 13 and 15 have flexible TR90 temples which cannot be cut down to size or extended; however, we do have different length temple replacements available upon request (110mm, 120mm, and higher).

We have spare parts available upon request: screws, nose pads, and temple tips.
